MOGS 2MM - M65 TB

The M65 TB series allows the manufacturing of large openings with a streamlined visual impact and maximum stability. M65 TB profiles have a section in view of only 18 mm and are made from solid 2 mm thick sheet metal, with thermal break. The depth of the profile, from 65 to 72 mm, is designed to achieve high moments of inertia and to accommodate the latest generation of insulating glass. The PA 6.6 polyamide insulating core guarantees excellent performance in terms of energy saving.

Available in galvanized steel, Cor-Ten steel, stainless steel and bright steel.

EN 12207	EN 12208	EN 12210	EN ISO 10077-1
			
Air permeability	Water Thightness	Resistance to wind load	Heat transfer coefficient*
4 Class - 600 Pa	7A Class - 300 Pa	C4 Class- 1600 Pa	Uw = 1.00 W/m2K

*calculated on sample standardized window frame dim. 1230x1480 mm according to the EN 14351-1

FEATURES

- | | | |
|--|--|--|
| 1. 2 mm tubular profile in galvanized steel with high moments of inertia | 5. profile depth compatible with high performance insulating glass up to 46 mm thick | conceived hinges |
| 2. continuously welded profile, high mechanical performance | 6. thermal barrier in PA 6.6 polyamide | 9. any kind of openings: side-hung, top-hung and bottom-hung windows, tilt and turn, pivoting and folding doors. |
| 3. external flush and internal overlapping sightlines | 7. choice of different glazing beads | 10. surface finishes in any customized or RAL colours, for a great planning freedom |
| 4. mechanically fixed rebate gaskets | 8. wide choice of specific fittings, including both visible and | |

DISTINCTIVE METALS

Cold formed steel

Cold-rolled steel profiles - whether bright or galvanized - have a uniform texture, which lends itself well to multiple finishes. Light brushing or blackening can be used as an alternative to traditional painting, and allow a high level of customization of the frame. In interior design, the surfaces can be left natural or simply galvanized, to create industrial-style openings. The corners of cold rolled steel doors and windows are always welded. Depending on the desired visual quality, the welds can be grounded flat, left natural or even emphasized by brushing or blackened with special patinas. The Series FerroFinestra W50 TB and FerroFinestra W75 TB are cold rolled in high-precision production lines to ensure perfect windows and doors.

Cor-Ten steel

Cor-Ten is a material of great scenic effect and extraordinary elegance. In recent years, it has become a very popular material for windows and doors, both for restoration and for new buildings. Cor-Ten is a natural, living material that takes on different and unique shades over time and through exposure to the elements. The natural oxidation process can also be controlled chemically, with procedures that reduce natural “bleeding”. In order to contain these phenomena, however, it is advisable to plan periodic treatments with applications of suitable waxes or oils. The corners of the frames are suitably welded, and the welding mark can be left natural or ground flat.

Stainless steel

The technical properties and remarkable resistance over time make stainless steel a very popular material used in construction and architecture since 1920. Its exceptional characteristics allow its use even in areas subject to strong environmental aggression, for roofs, curtain walls, doors and windows of very long duration, in almost total absence of maintenance. Appreciated above all for its metallic sheen, stainless steel allows extreme design freedom in terms of surface finishes, such as “black stainless steel”, which can be obtained by applying special patinas on the brushed or sandblasted surface. Thanks to its natural and evocative texture, black stainless steel gives windows and doors an exclusive character. The corners of windows and doors made from cold rolled stainless steel profiles are mainly welded and welds are ground flat and polished. The steel chosen by Ottostumm | Mogs in the family products FerroFinestra W75 TB and Mogs 65 TB is considered as the best stainless steel alloy, AISI 316L stainless steel, containing the largest amount of molybdenum. AISI 316L is normally called “marine steel” because it is able to resist corrosion even in a highly salty environment.
